Such a transition would require a continual correction, amounting, in fact, to the process of the last article: but $\tan^{-1}\tan j$; is, by definition, the angle which lies between--it and + g, and has x for its tangent. The student should now prove the following theorems, illustrative of the limitation of F 1, as distinguished from F i. $T = 3-14159265352$ which is correct, with the exception of the last place. all similar equations, and explain under what limitations they are true. It must be observed that every such equation becomes true (134.) when $\sin i$, c. are substituted for \sin^{-1} , c. But it does not follow that the same value of m in the general equation $\sin ia = 2ffl + \sin lx = (2m + l)5r^{-\sin-1a}$; must be applied on both sides of the equation. (150.) The angle \sin^{-1} is made, by convention, a periodic angle. It changes through 0, -, 0, --, 0, c. while x changes through 0, 1, 0, --1,0, c. If x be greater than 1, the angle \sin^{-1} becomes impossible. If in the expressions for $\sin i$ and $\cos x$, we write $x/\sqrt{-1}$ for x, we have $2 \sqrt{-1} i \sin^{-1} x = \cos^{-1} x$. The right hand sides of the equations are no longer periodic; and in the same way as all functions of sines, cosines, c. may be expressed by exponential functions of x and $\sqrt{-1}$, so all exponential functions may be...
